

# MAXIMIZE UPTIME

**"If the production line is not up,  
somebody is going down!"**

**Said every plant manager ever.**

In many food production facilities, an hour of down-time can easily exceed \$100,000. Sentinel Activity Monitoring can greatly reduce unexpected downtime by identifying system anomalies, such as intermittent loss of flow, internal by-pass, burned-out solenoid coils and slow opening/closing valves in industrial refrigeration systems. With this knowledge, pre-emptive and predictive maintenance is possible. This means more planned maintenance repairs and less time troubleshooting.

This low-voltage, non-intrusive solution can be easily retrofitted to all common manufacturer's refrigerant valves.

**Get Sentinel and avoid getting "the Call"!**

Contact us for more information on Sentinel and our enterprise-wide accessible cloud-based dashboards and notifications.
